

The unique belt tensoning system developed by RÖMER has been further improved upon in these two child seats („TS“ stands for Tensoning System). The design automatically tensions the car seat belt upon installation of the child seat to help achieve a secure installation without additional effort. The procedure is as easy as this:

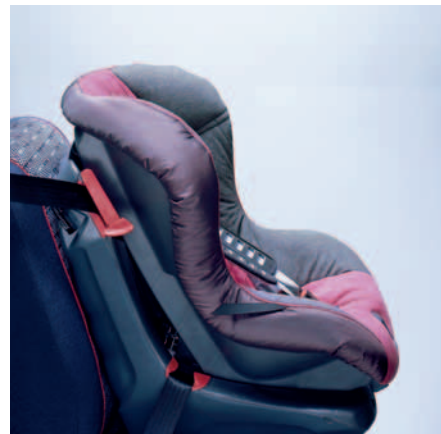

Fold the seat shell forward and insert the belt.

Close the belt clamp.

Fold the seat shell backward.

The belt is tensioned automatically.

Thanks to the tilting facility of the seat shell, the route that the belt takes is easily accessible, even with little room in the car.

Insert belt, tilt shell backward and the automatic tensoning system takes effect. It fixes the RÖMER KING TS perfectly on the car seat.
